

乘风破浪的开学季

爱思唯尔 ScienceDirect 短视频活动征集啦!

- ◆ **活动主题:** ScienceDirect 如何赋能科学研究?
- ◆ **提交时间:** 2022年10月1日 - 11月30日
- ◆ **征集要求:** 围绕“ScienceDirect 如何赋能科学研究”这一话题进行原创短视频创作, 自选切题角度, 具体内容和视频样式不限, 视频总时长需控制在四分钟以内, 视频中需要包含 ScienceDirect 全文文献的展示画面。
- ◆ **报名形式:** 个人与团队均可报名参加, 团队人数不得超过 3 人

我们期待透过你的视频
看到你对科研的无限热爱

马上参与吧! 大奖在前方等着你哦~

一等奖 (3名)

Use Boolean operators to combine multiple terms:

- Boolean operators currently supported include AND, OR, NOT, and the hyphen (or minus symbol)
- Boolean operators must be entered in all uppercase
- The hyphen (or minus symbol) is interpreted as the NOT operator

For example: `black -hole` will return results containing 'black', but exclude any instances where 'hole' appears with it.

- Boolean precedence is as follows:

1. NOT
2. AND
3. OR

NOT

AND

OR

- Parentheses can be used when nesting clauses so the grouping is clear

For example: For `a OR b AND c`, enter `a OR (b AND c)`

- Quotation marks can be used to specify terms which must appear next to each other

For example: `("heart attack" OR "myocardial infarction") AND diabetes AND NOT cancer`

The Cloned Capsaicin Receptor Integrates Multiple Pain-Producing Stimuli

Abstract

摘要

Capsaicin, the main pungent ingredient in “hot” chili peppers, elicits burning pain by activating specific (vanilloid) receptors on sensory nerve endings. The cloned vanilloid receptor (VR1) is a cation channel that is also activated by noxious heat. Here, analysis of heat-evoked single channel currents in excised membrane patches suggests that heat gates VR1 directly. We also show that protons decrease the temperature threshold for VR1 activation such that even moderately acidic conditions ($\text{pH} \leq 5.9$) activate VR1 at room temperature. VR1 can therefore be viewed as a molecular integrator of chemical and physical stimuli that elicit pain. Immunocytochemical analysis indicates that the receptor is located in a neurochemically heterogeneous population of small diameter primary afferent fibers. A role for VR1 in injury-induced hypersensitivity at the level of the sensory neuron is presented.

Localization of TRPV1

The capsaicin-sensitive vanilloid receptor is expressed mainly in sensory nerves including those emanating from the dorsal root ganglia and afferent fibers that innervate the airway, which originate from the vagal ganglia. In the dorsal root and trigeminal ganglion, TRPV1 is localized to small and medium-sized neurons. Somatic

Pre-Clinical Research

Administration of capsaicin to neonatal and adult animals has produced a wide range of effects and many discrepancies exist in the literature, see Gamse (1982). There also appear to be species differences. The data shown represent a sampling of the literature.

Quantum turbulence simulations using the Gross–Pitaevskii equation: High-performance computing and new numerical benchmarks

Paper abstract

摘要

We present high-performance and high-accuracy numerical simulations of quantum turbulence modelled by the Gross–Pitaevskii equation for the time-evolution of the macroscopic wave function of the system. The hydrodynamic analogue of this model is a flow in which the viscosity is absent and all rotational flow is carried by quantized vortices with identical topological line-structure and circulation.

Computer Physics Communications publishes research papers and application software in the broad field of computational physics; current areas of particular interest are reflected by the research interests and expertise of the <https://www.journals.elsevier.com/computer-physics-communications/editorial-board/CPC> Editorial Board.

The focus of CPC is on contemporary computational methods and techniques and their implementation, the effectiveness of which will normally be evidenced by the author(s) within the context of a substantive problem in physics. Within this setting CPC publishes two types of paper.
